

Dock Seals & Dock Shelters

Overview

Dock seals and dock shelters are essential solutions for maintaining energy efficiency, reducing contamination, and protecting products at loading docks. They create a barrier that minimizes heat loss, prevents external contaminants like dust and pests from entering, and shields the facility from adverse weather conditions. These solutions are available in various configurations to suit different dock applications, including compression dock seals, inflatable dock seals, and full-access dock shelters.

Dock Seals

Overview

Dock seals provide a tight compression seal around the trailer's top and sides, ensuring the highest sealing efficiency. These are ideal for facilities where trailers are of consistent height. Models such as the Fixed Head Pad Dock Seal and Classic Dock Seal offer features like foam compression for a snug fit, reinforced corner pleats for durability, and optional fire-resistant technology for added safety.

Dock Shelters

Overview

Dock shelters offer flexibility by providing unobstructed access to the trailer while sealing against the trailer top and sides with industrial-grade fabric curtains. They are designed to accommodate varying trailer sizes and provide high sealing efficiency. Models like the Adjustable Inflatable Dock Seal and HingeMaster™ Extreme Dock Shelter ensure superior energy conservation, reduce hinge gaps, and protect against weather-related damage.
