

Fire and Smoke Vents

- Automatic smoke vents provide critical fire safety by allowing smoke, heat, and gases to escape during a fire. They are designed for large spaces like warehouses, factories, and commercial buildings. Available in various materials and sizes, these vents ensure the safe evacuation of dangerous fumes and enhance building protection.

Features:

- **Thermolatch® II Mechanism:** Ensures automatic release of the vent covers during a fire, triggered by a fusible link that melts at 165°F (74°C).
- **Powerful Lifting Mechanisms:** Engineered with gas spring operators to open covers even in snow and wind conditions.
- **Controlled Opening:** Integral dampers ensure a smooth and controlled opening to avoid operational or structural damage.
- **Weather Resistance:** Fully insulated and gasketed for weather-tightness.
- **Corrosion-Resistant Construction:** Made from durable materials for long-lasting, reliable performance.
- **UL-Listed Sizes:** Available in a range of standard sizes to meet regulatory requirements.

Benefits:

- Enhances fire safety by allowing quick venting of smoke and gases.
- Automatically operates during a fire, reducing the need for manual intervention.
- Designed for easy reset after use, ensuring minimal downtime.
- Provides long-term durability and protection against weather and corrosion.
- Meets industry safety standards and building code requirements.

Applications:

- Ideal for large buildings such as warehouses, manufacturing plants, and commercial spaces.
- Useful in high-risk areas where fire safety is paramount.
- Designed for both new construction and retrofit projects.
