

Flagpoles and Related Hardware

Windtracker®

The Windtracker® System is designed to attach to existing poles like light standards. It consists of a horizontal arm and a vertical pole that attaches around the fixed pole or light standard. It's a popular style for open spaces and parking lots. Windtracker® rotates with the wind to reduce stress on the banner and prevent wrap around. A ladder truck will be required to install. It would also be needed to change the banners unless you also purchase the optional raising and lowering system. This raise and lower system means, after the initial installation, you can switch the banners from the ground as needed. A really great feature!

Commercial Flagpoles®

Flags Unlimited stocks a comprehensive line of aluminum commercial cone-tapered flagpoles. Our poles are manufactured using seamless tubing (Alloy 6063-T6), the best choice for aluminum flagpoles making them light weight and maintenance free. Our flagpoles are cone-tapered, meaning the base of the pole is larger than the top. This creates stability and adds a pleasing aesthetic quality. The finish on these poles is brushed satin.
